

Double Band Inversion in TMD $X\text{Te}_2$

Xiaoxiong Liu

University of Zurich

November 15, 2019

- 1 DBI in TMD
- 2 Topology in β phase
- 3 Tight-Binding Model for MNL
- 4 Topology in γ phase

Why I am interested in DBI

Zhijun Wang (2019)

Higher-Order Topology, Monopole Nodal Lines, and the Origin of Large Fermi Arcs in Transition Metal Dichalcogenides XTe_2 ($X = Mo, W$)

PRL 123,186401 (2019)

Figure: Bands

TMD Structure

Room temperature: hexagonal α phase ($P6_3/mmc$) and distorted monoclinic β phase ($P2_1/m$). Under 250K: β phase transitions into γ phase ($Pmn2_1$)

Figure: β -1T'-MoTe₂

Figure: DBI

Monopole Nodal Line and HOTI in β phase

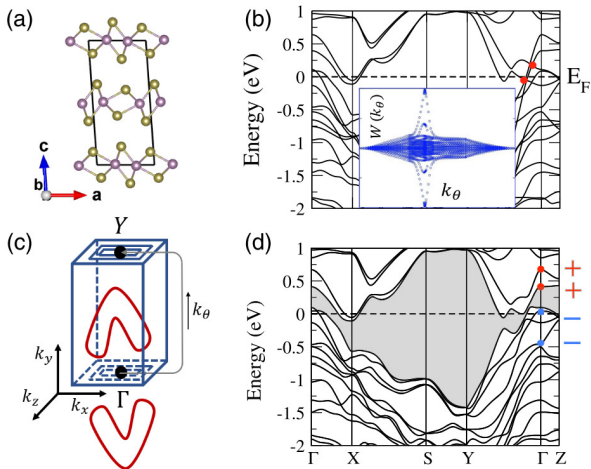

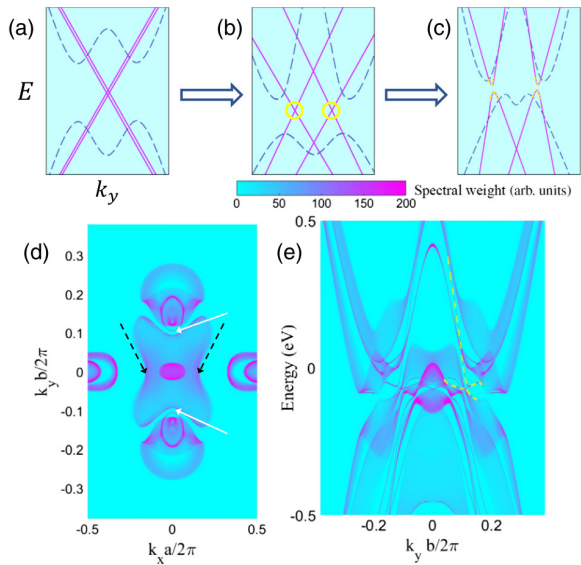

Figure: MNL

TRIM	Γ	X	Y	Z	S	T	U	R
$n_-(\vec{k})$	12	14	14	14	14	14	14	14

Figure: The number of Kramers pairs with -1 parity eigenvalues $n_{(k)}$ at each TRIM point in β phase. The Z_2 index can not work anymore. The Z_4 index changed by 2.

Tight-Binding Model for MNL

$$H(k) = (m_1 + \sum_{i=x,y,z} v_i \cos(k_i)) \tau^z + m_2 \tau^z \mu^x + m_3 \tau^z \mu^z + u_x \sin(k_x) \tau^y \mu^y + u_z \sin(k_z) \tau^x \quad (1)$$

Orbital τ and μ Pauli matrices.

Figure: TB

Under Inversion symmetry and spinless time-reversal symmetry.

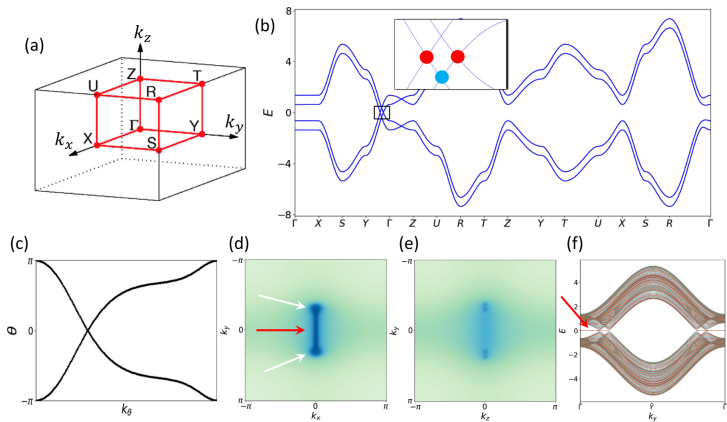

Figure: TB

k.p theory exploit the nested Jackiw-Rebbi construction. Get a term $m_{v1}\mu^z + m_{v2}\mu^x$

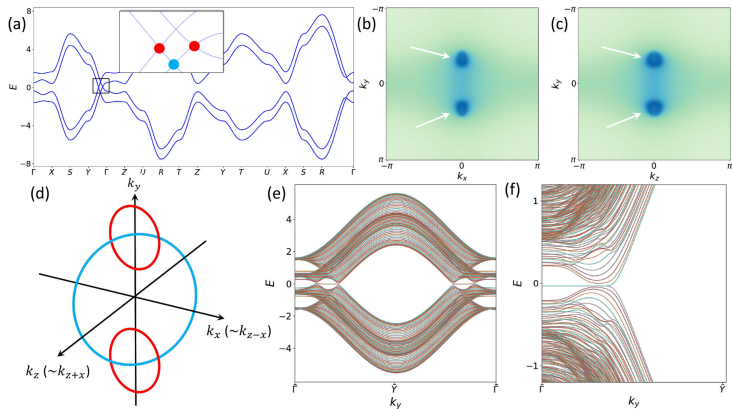

Figure: TB

$$V_{HOIT} = v_H \sin(k_y) \tau^y \mu^z \sigma^z$$

Figure: HOIT

Topology in γ phase

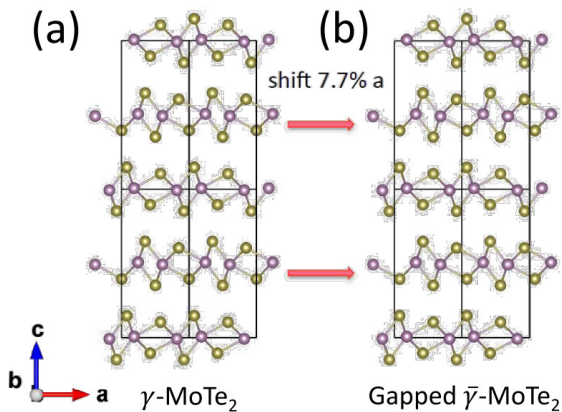

Figure: γ phase

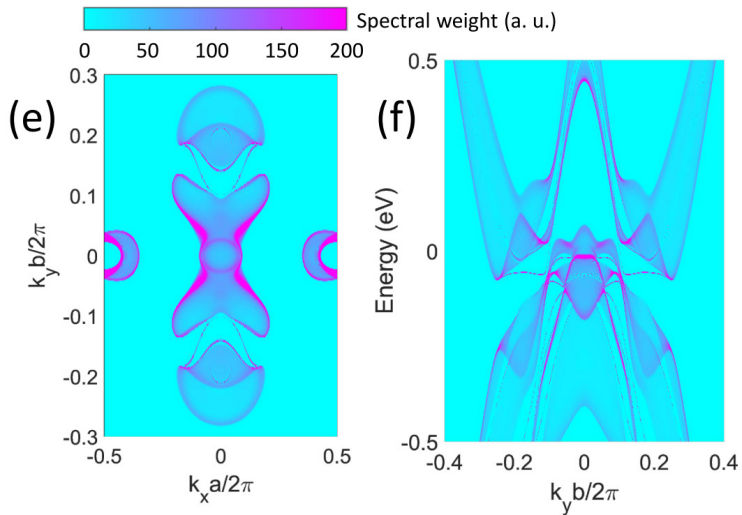

Figure: surface

Origin of Large Fermi arcs

γ -XTe₂ crystals also exhibit huge, arc-like surface states that largely overwhelm possible signatures of topological Weyl Fermi arcs. Previous works determined these large surface arcs to be topologically trivial. However, in light of our previous analysis of similar nontrivial surface states in β -MoTe₂, we recognize this determination to be incomplete. By explicitly calculating the surface states and bulk topology of γ -MoTe₂ when its Weyl points are gapped by slight distortion, we, instead, discover that the large Fermi arcs in γ -XTe₂ represent the split surface Dirac cones of a nonsymmetry-indicated HOTI phase that is nearby in parameter space and driven by DBI. (A guess)
