

Mini conference: Measurement invariance: Methods, problems and further directions

Zurich 15July2010

Political Trust and Social Trust

**Trends and comparison between
Catalunya (Spain) and The Netherlands**

Lluís Coromina, University of Girona

■ Background

■ Measurement of Social Trust

■ Cross-national comparison with MGCFA with testing for invariance.

■ Measurement of Social Trust

■ Comparison of latent means and composite mean

■ Trends in Catalunya and The Netherlands related social and political trust.

Background

Social Capital:

■ Instrumental or Individual Theory: James Coleman, Pierre Bourdieu... Social networks and resources.

■ Cultural or Attributes: Putnam,....

Political culture focus on a collective (civil participation) and distribution of rules and values in the society that together with individuals and its social relation create trust.

■ Structural attributes: Informal networks (relationship with family members, peers)

Formal networks (member, participate... in voluntary organizations).

■ Cultural attributes: trust ***social trust***: relying on other people,

political trust: institutions and political representatives.

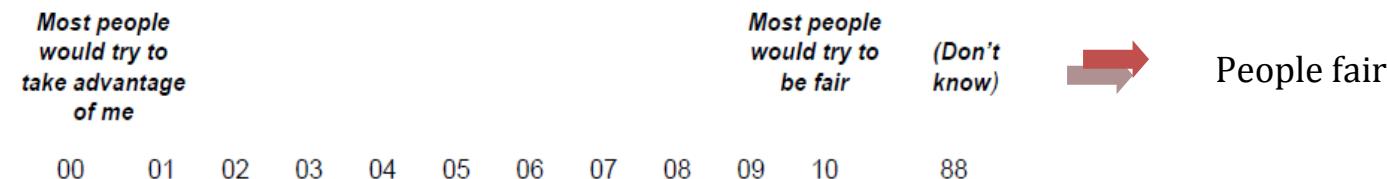

Civic values and norms of general character considered to be shared by a number of individuals or the community as a whole.

Measurement of Social Trust

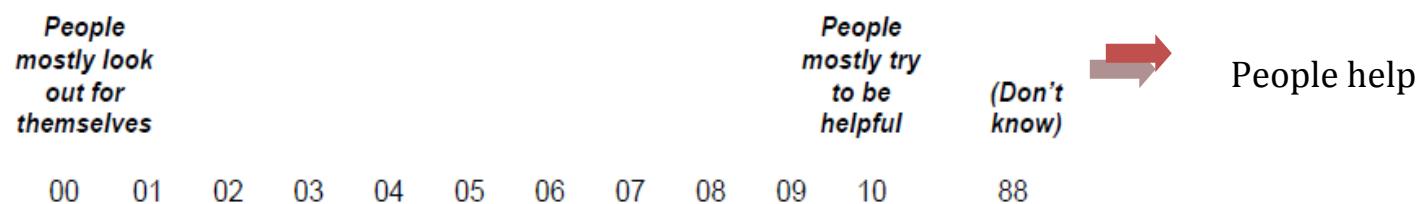

CARD 3: Using this card, generally speaking, would you say that most people can be trusted, or that you can't be too careful³ in dealing with people? Please tell me on a score of 0 to 10, where 0 means you can't be too careful and 10 means that most people can be trusted.

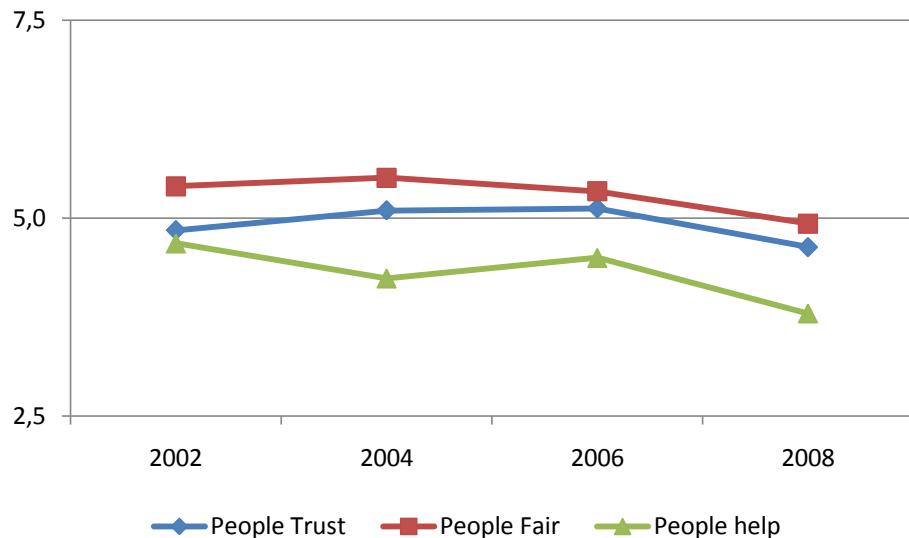

CARD 4: Using this card, do you think that most people would try to take advantage⁴ of you if they got the chance, or would they try to be fair?

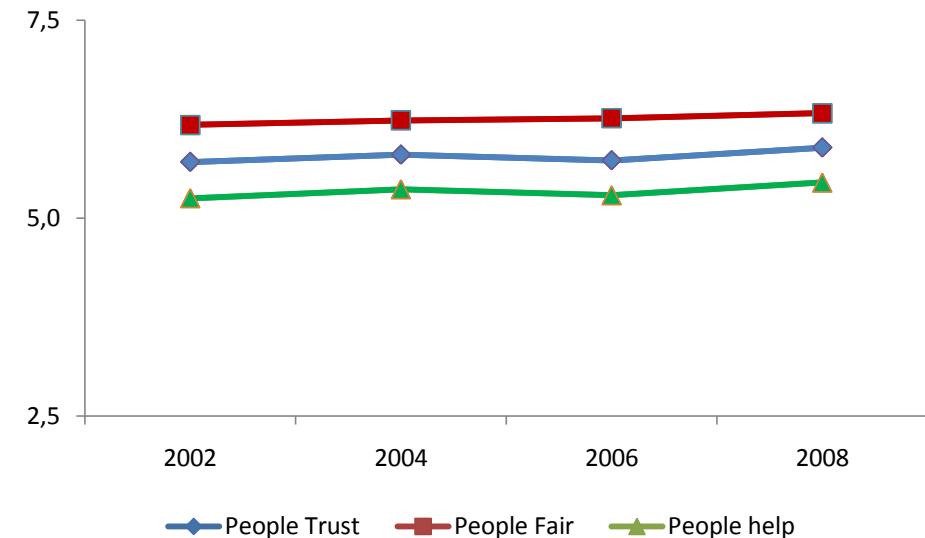

CARD 5: Would you say that most of the time people try to be helpful⁵ or that they are mostly looking out for themselves? Please use this card.

Catalunya

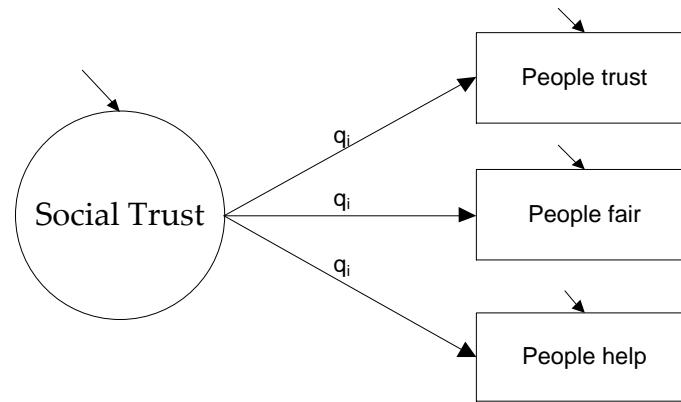

Netherlands

Netherlands: Scores > 5 points and are very similar trend to each other.

Catalunya: Lower scores for three questions between 2006 and 2008.

Confirmatory Factor Analysis (CFA) for Social Trust

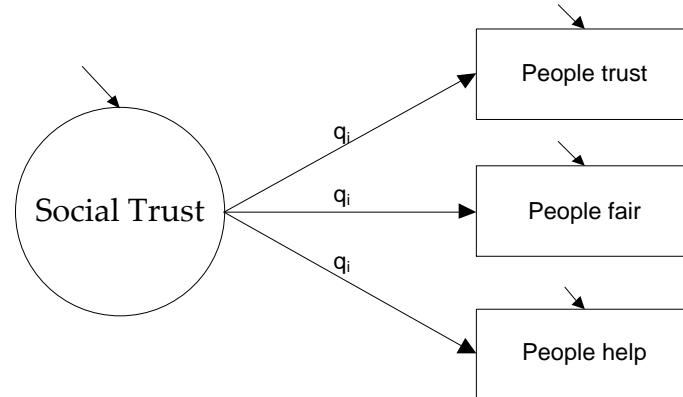

The model with **no parameters constrained** to be equal across **countries** is just identified, meaning that no test for the model is possible.

Comparability across countries

In order to be able to compare relationships and means across countries one has to show first that the measures in the different countries are comparable.

Saris & Gallhofer (2007) show that this does not necessarily mean that the measures are equally good.

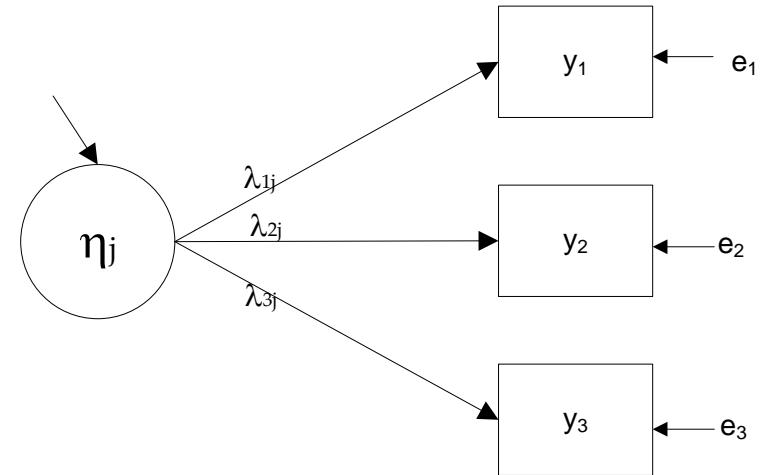

We need to test for “**Invariance of Measurement Instruments**” across countries.

Saris, W. E., & Gallhofer, I. N. (2007). *Design, evaluation, and analysis of questionnaires for survey research*. Hoboken, N.J.: Wiley-Interscience.

Testing for cross-cultural Equivalence

■ **Configural Invariance:** Same pattern across countries

$$y_1 = \tau_1 + \lambda_{11}\eta_1 + e_1$$

$$y_2 = \tau_2 + \lambda_{21}\eta_1 + e_2$$

$$y_3 = \tau_3 + \lambda_{31}\eta_1 + e_3$$

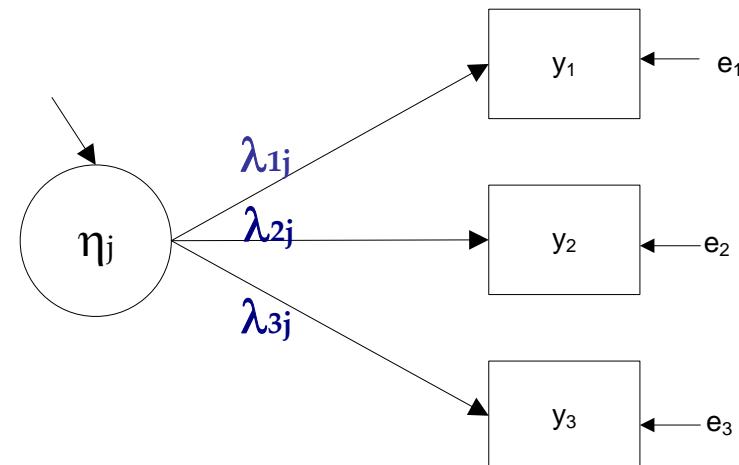

$$E(e_i) = E(e_i \eta_l) = E(e_i e_j) = 0 \text{ for } i \neq j$$

Testing for cross-cultural Equivalence

■ **Configural Invariance:** Same pattern across countries

■ **Metric Invariance:** Loadings equal across countries (λ_{ij}).

Comparison of relationships.

$$y_1 = \tau_1 + \lambda_{11}\eta_1 + e_1$$

$$y_2 = \tau_2 + \lambda_{21}\eta_1 + e_2$$

$$y_3 = \tau_3 + \lambda_{31}\eta_1 + e_3$$

$$E(e_i) = E(e_i \eta_l) = E(e_i e_j) = 0 \text{ for } i \neq j$$

Testing for cross-cultural Equivalence

■ **Configural Invariance:** Same pattern across countries

■ **Metric Invariance:** Loadings equal across countries (λ_{ij}).

Comparison of relationships.

■ **Scalar Invariance:** Loadings (λ_{ij}) and intercepts (τ_{ij})
equal across countries.

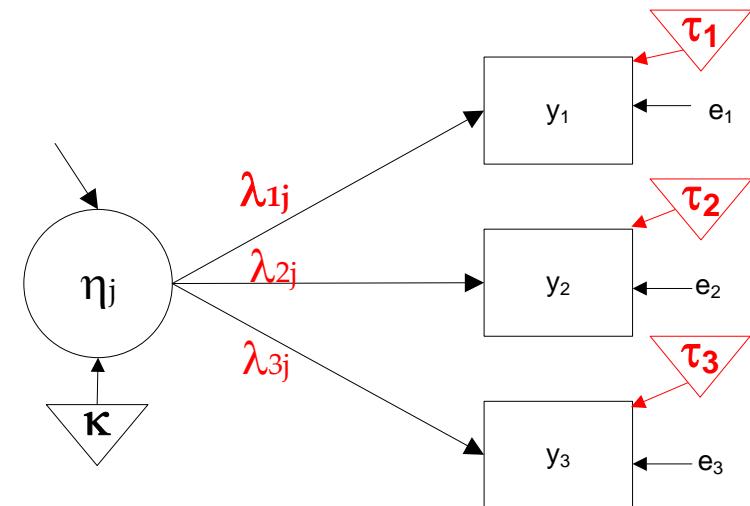

Comparison of latent means (κ).

$$y_1 = \tau_1 + \lambda_{11}\eta_1 + e_1$$

$$y_2 = \tau_2 + \lambda_{21}\eta_1 + e_2$$

$$y_3 = \tau_3 + \lambda_{31}\eta_1 + e_3$$

$$E(e_i) = E(e_i \eta_j) = E(e_i e_j) = 0 \text{ for } i \neq j$$

Fit of the model with SEM

This was detected with a procedure which has been developed by Saris, Satorra & Van der Veld (2009). This method determines whether misspecifications are present in the specified model.

Fit criteria of the models:

- To determine whether misspecifications are present in the specified model (Saris, Satorra & Van der Veld, 2009).
- Procedure based on the size of MI, the power of the test for misspecifications and the EPC to determine whether a restriction is most likely incorrectly made.

		Power	
		High	Low
MI	Significant	Use EPC	Misspecification
	Not	No misspecification	No decision

From EPC and MI → s.e of the EPC (σ_{EPC}) and the power of the test.

$$\sigma_{EPC} = \frac{EPC}{\sqrt{MI}}$$

The power of the test (Noncentrality Parameter) → probability of detecting a misspecification of size Δ in the estimates

$$NCP = \left(\frac{MI}{EPC^2} \right) \Delta^2$$

Jrule

Help to detect misspecifications in the model!

The screenshot shows the Jrule for Mplus beta software interface. The window title is "Jrule for Mplus beta". The menu bar includes "File", "Edit", "Tools", and "Help". Below the menu is a text input field "Output file to read:" containing "social_trust2004.out". There are three tabs at the top: "Parameters and misspecifications" (selected), "Misspecification plots", and "Change decision rules". Below the tabs are three filter buttons: "Filter by parameter", "Filter by decision", and "Filter by group". A table follows, with columns: Parameter, Decision, Group, MI, EPC, Power, and NCP. The data rows are:

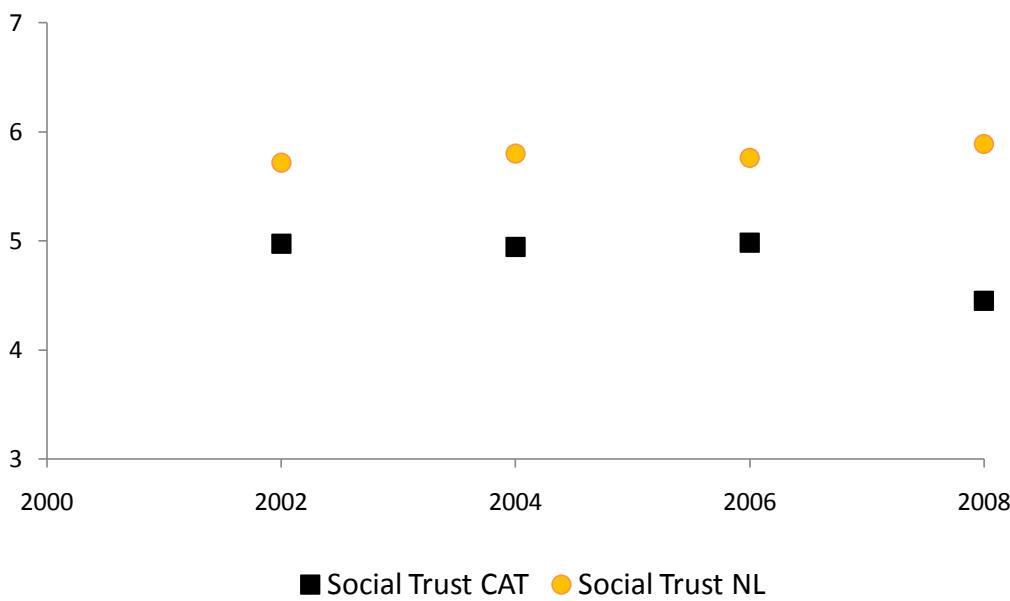

Parameter	Decision	Group	MI	EPC	Power	NCP
ST BY PPLHLP	Not misspecified (EPC < delta)	1	15.512	-0.018	1.000	478.765

Measurement of Political Trust

Some studies refer to the question: ***Trust in parliament in the country.***

Political trust is a complex concept, which can be affected by the difference to individuals, groups or political institutions.

Political Trust is a complex concept → A ***combination of measures*** is most appropriate to measure the concept that one, higher reliability (Allum, N., Patulny, R., Read, S., & Sturgis, P. (2010); llum, N., Read, S., & Sturgis, P. (in press); Guillén, L., Coromina, L., & Saris, W. (2011).

Rothstein & Stolle (2002) differentiated between

political and representative institutions (parliament, political parties, government)

groups of order (police, army, justice, schools ...)

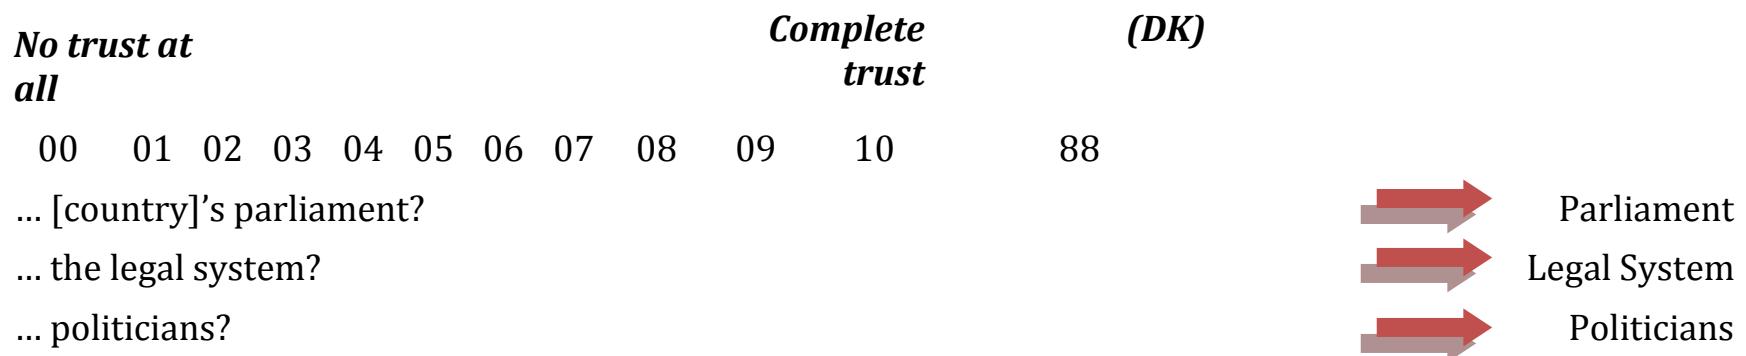

control institutions (newspapers, officials or public employees).

Torney-Purta et al. (2004) found ***political institutions*** (parliament, government, political parties)

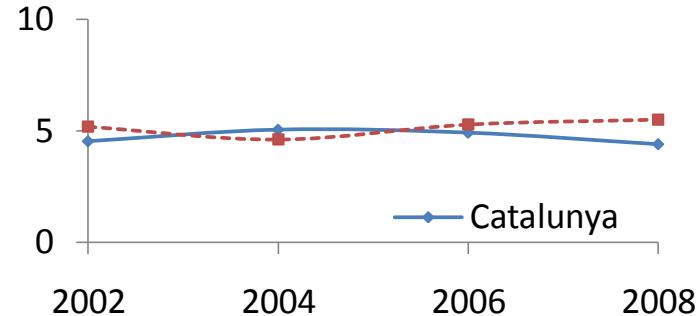

other representatives who maintain more direct relationship with citizens (schools, police,...).

Following the argument of these investigations, this criterion is followed in this work where trust is defined as a combination of political confidence in the national parliament, government and politicians.

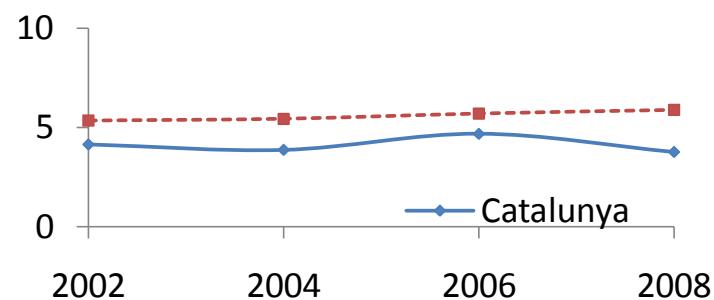

CARD 11: Using this card, please tell me on a score of 0-10 how much you personally trust each of the institutions I read out. 0 means you do not trust an institution at all, and 10 means you have complete trust.

Cross-national Invariance Test for Political & Social Trust

Correlation between latent factors taking into account the possible measurement error.

CFA's gives correct orientation on the variables that make each type of trust

(**) Some high MI, but not misspecification according Jrule criteria because low EPC and high power. If only χ^2 is used, then misspecification in the model.

Jrule: Help to detect misspecifications in the model!

	Catalunya	3.515	3.515	4.034	3.042	

Comparing means

- The means of the **latent** variable Social and Political Trust across countries is correct if **at least two** indicators are scalar invariant
- The **composite scores** require that **all** indicators are scalar invariant
- If the deviations are large the differences between the means across countries should be large and the correlation between the means should be low.

Conclusions

- Cross-national comparison with MGCFA with testing for invariance.
- Testing SEM... Fit measures!!!
- Comparison of latent means and composite mean
- Composite score and its quality
- Trends in Catalunya and The Netherlands related social and political trust.
